Femtosecond Electron Imaging and Spectroscopy Workshop 01  
December 9, 2013

# Laser Plasma Accelerators have attractive qualities for applications

- ❖ Accelerator is **COMPACT** (mm to cm)
  - I. Gradient  $\sim 100$  MeV/mm
  
- ❖ LPAs produce **multiple forms of radiation**
  - I. Electrons (1 MeV to 4 GeV @ LOASIS)
  - II. THz (1 – 10 THz)
  - III. VUV (30nm) from undulator
  - IV. X-Ray (1 – 20 keV)
  - V. Gamma-Ray (MeV – GeV, simulated): Inverse Compton Scattering
  
- ❖ Laser,  $e^-$ s, THz, VUV, X-Rays &  $\gamma$ -Rays are
  - I. intrinsically synchronized
  - II. ultrashort (few fs)
  
- ❖ LPAs are **highly configurable**
  - I. Accelerator is dynamically created every shot
  - II. Density profile can be dynamically modified
  - III. Laser can be split and is easily configurable (energy, focal length)

# Overview

- ❖ Introduction to laser plasma accelerators (LPAs)
- ❖ Electrons from LPAs
  - I. Electron energies from MeV to GeV
  - II. Electron bunch temporal properties
  - III. Charge, divergence
- ❖ X-rays from LPAs
  - I. Undulator radiation
  - II. Betatron radiation
  - III. Inverse Compton Scattering
- ❖ THz as Coherent Transition Radiation (Source & Diagnostic)
- ❖ Applications
  - I. Electron diffraction

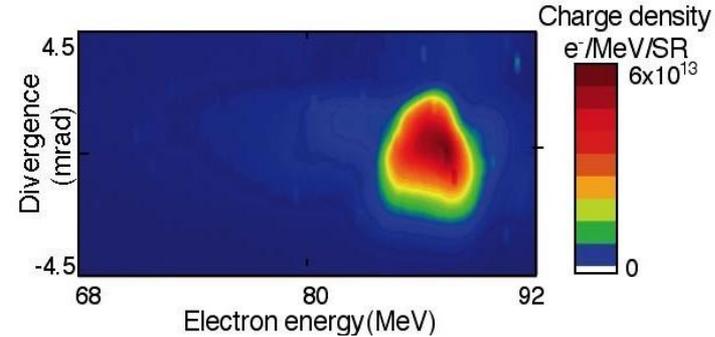

# Laser Plasma Accelerators put electrons on the table

$E_{Wakefield} \sim 10,000 E_{SLAC}$

Typical University Lab

9 TW:  $E = 86 \text{ MeV}$ ,  $\Delta E/E = 4.7\%$

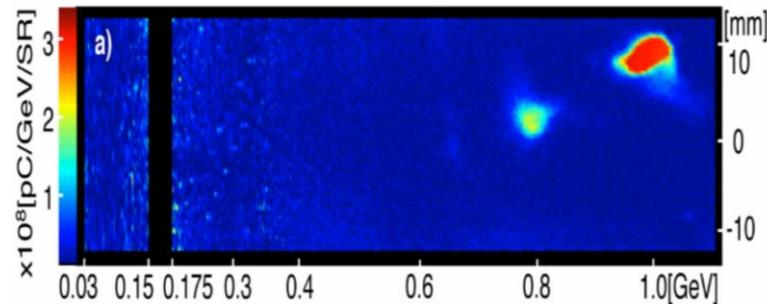

2004

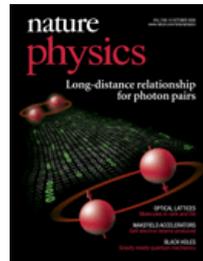

*Geddes et al., Nature 431, 538 (2004)*  
*Faure et al., Nature 431, 541 (2004)*  
*Mangles et al., Nature 431, 535 (2004)*

40 TW,  $E=1 \text{ GeV}$ ,  $\Delta E/E = 2.5\%$

2006

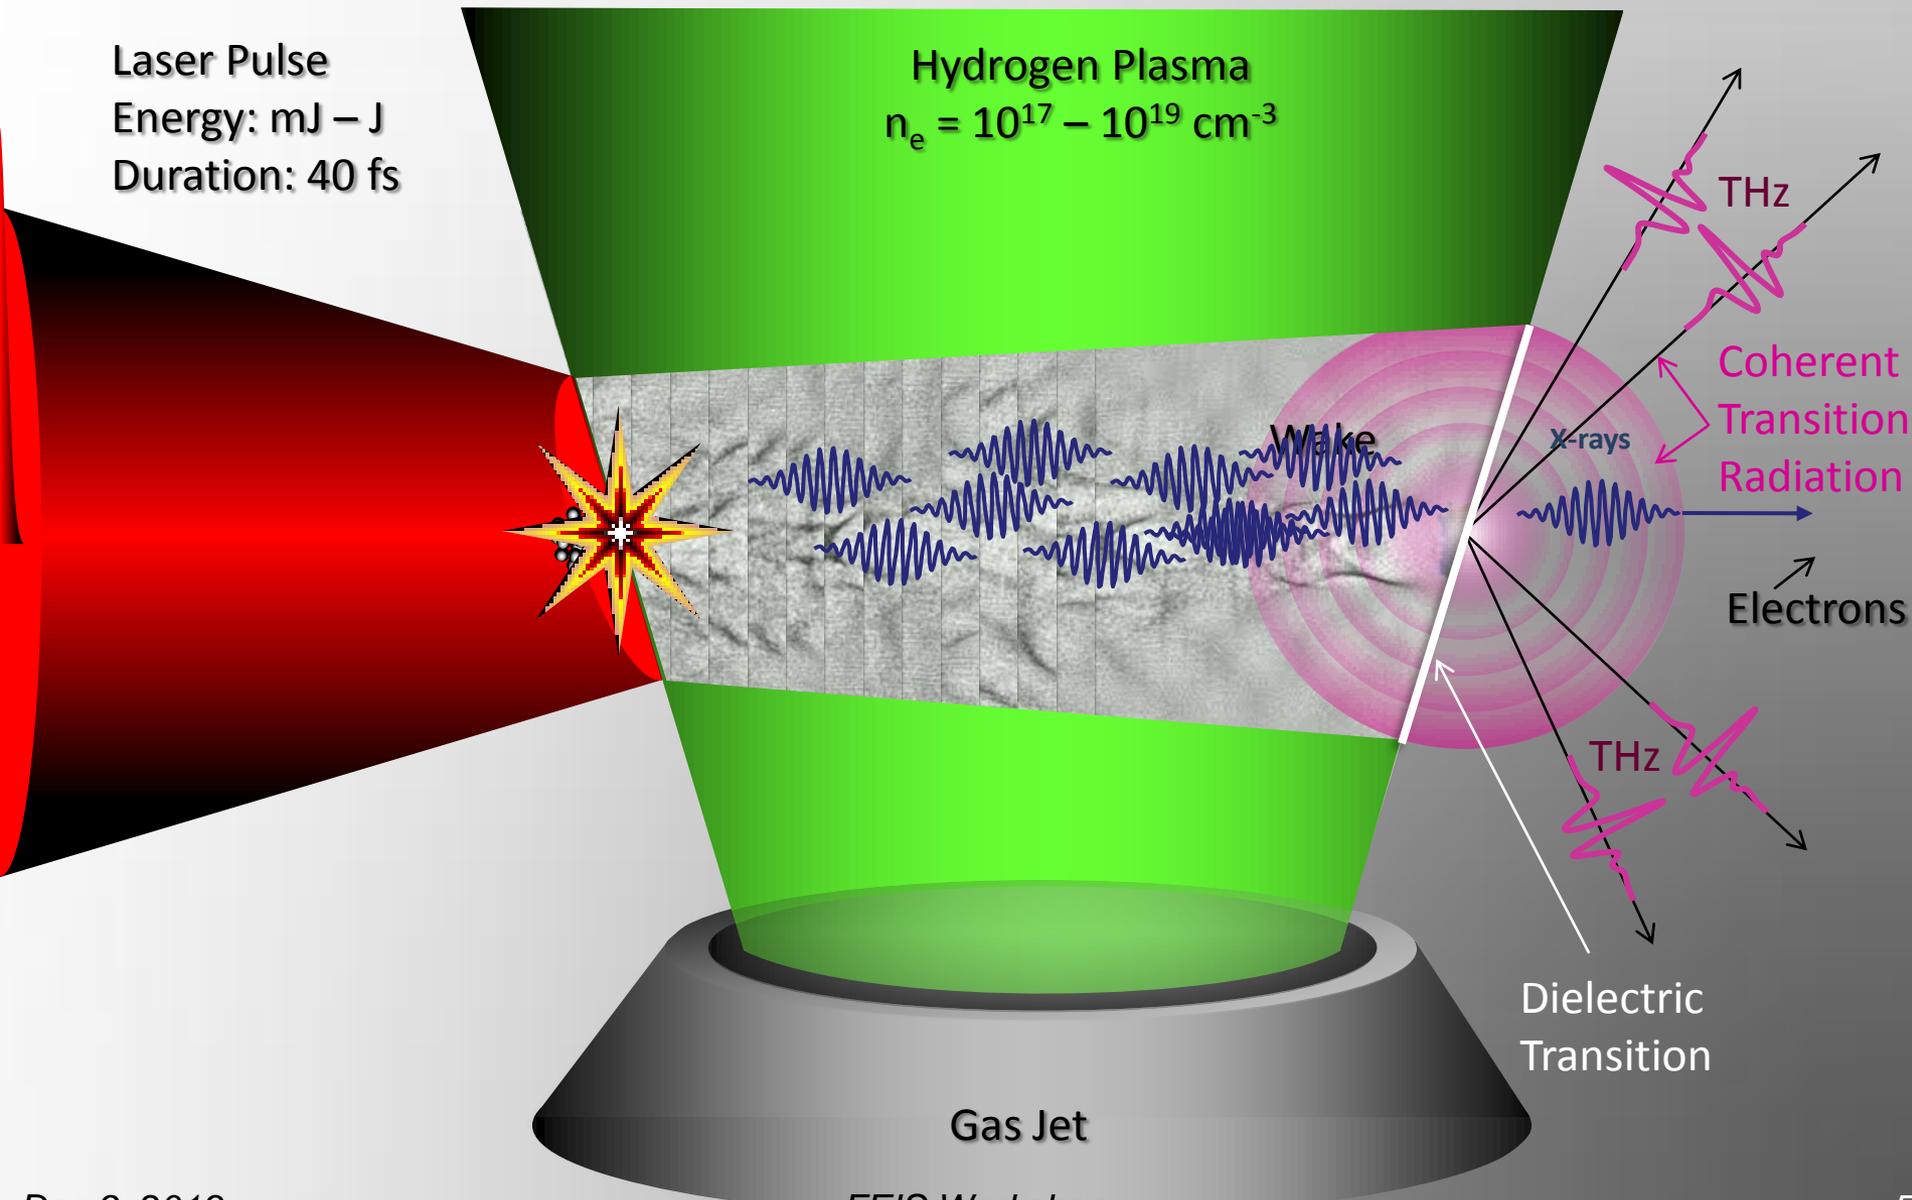

*Leemans et al., Nature Physics 2, 696 (2006)*

# Laser-Plasma Interaction

Laser Pulse  
Energy: mJ – J  
Duration: 40 fs

Hydrogen Plasma  
 $n_e = 10^{17} - 10^{19} \text{ cm}^{-3}$

Gas Jet

Dielectric Transition

Electrons

Coherent Transition Radiation

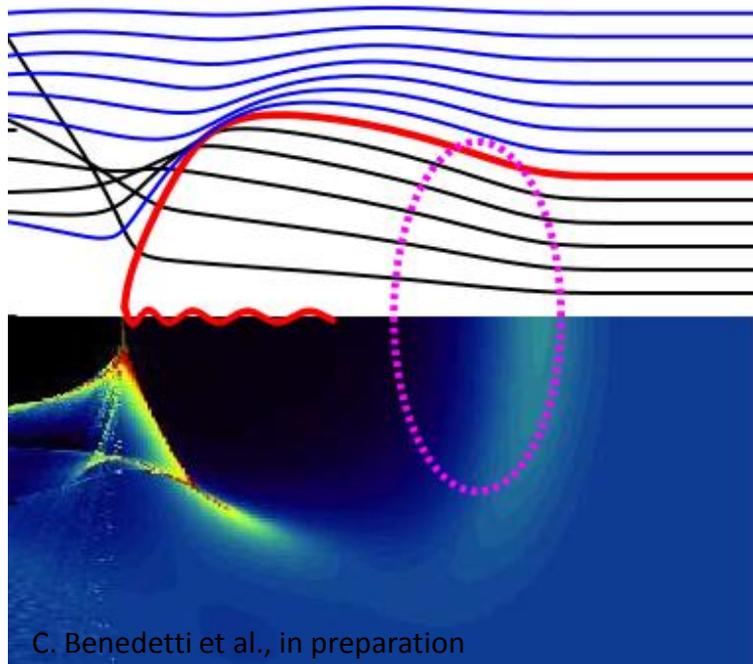

THz

THz

X-rays

Wake

# Plasma Acceleration structure generated by laser ponderomotive force

← Electrons in this orbit  
will get trapped

C. Benedetti et al., in preparation

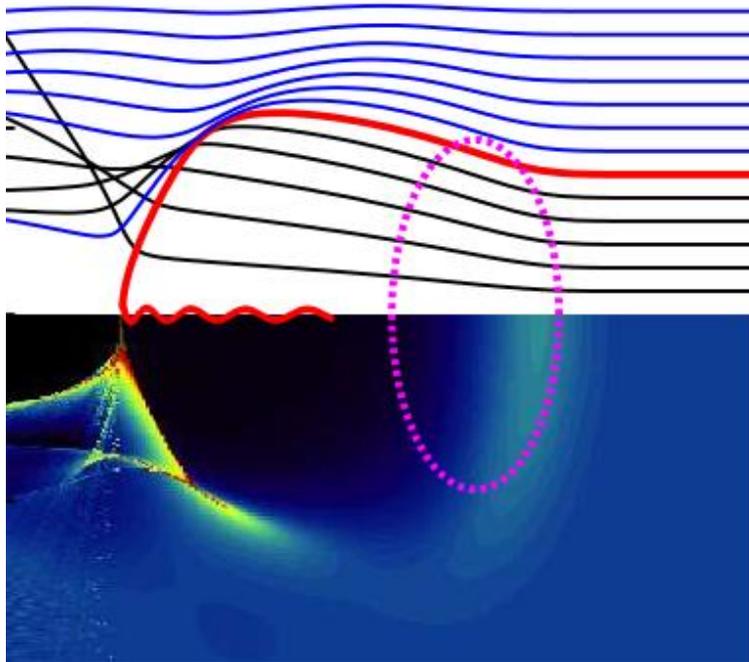

$$F_{pond} \propto -\vec{\nabla} I_{Laser}$$

## Theory of Bubble Regime:

# Laser Plasma Accelerator analogy

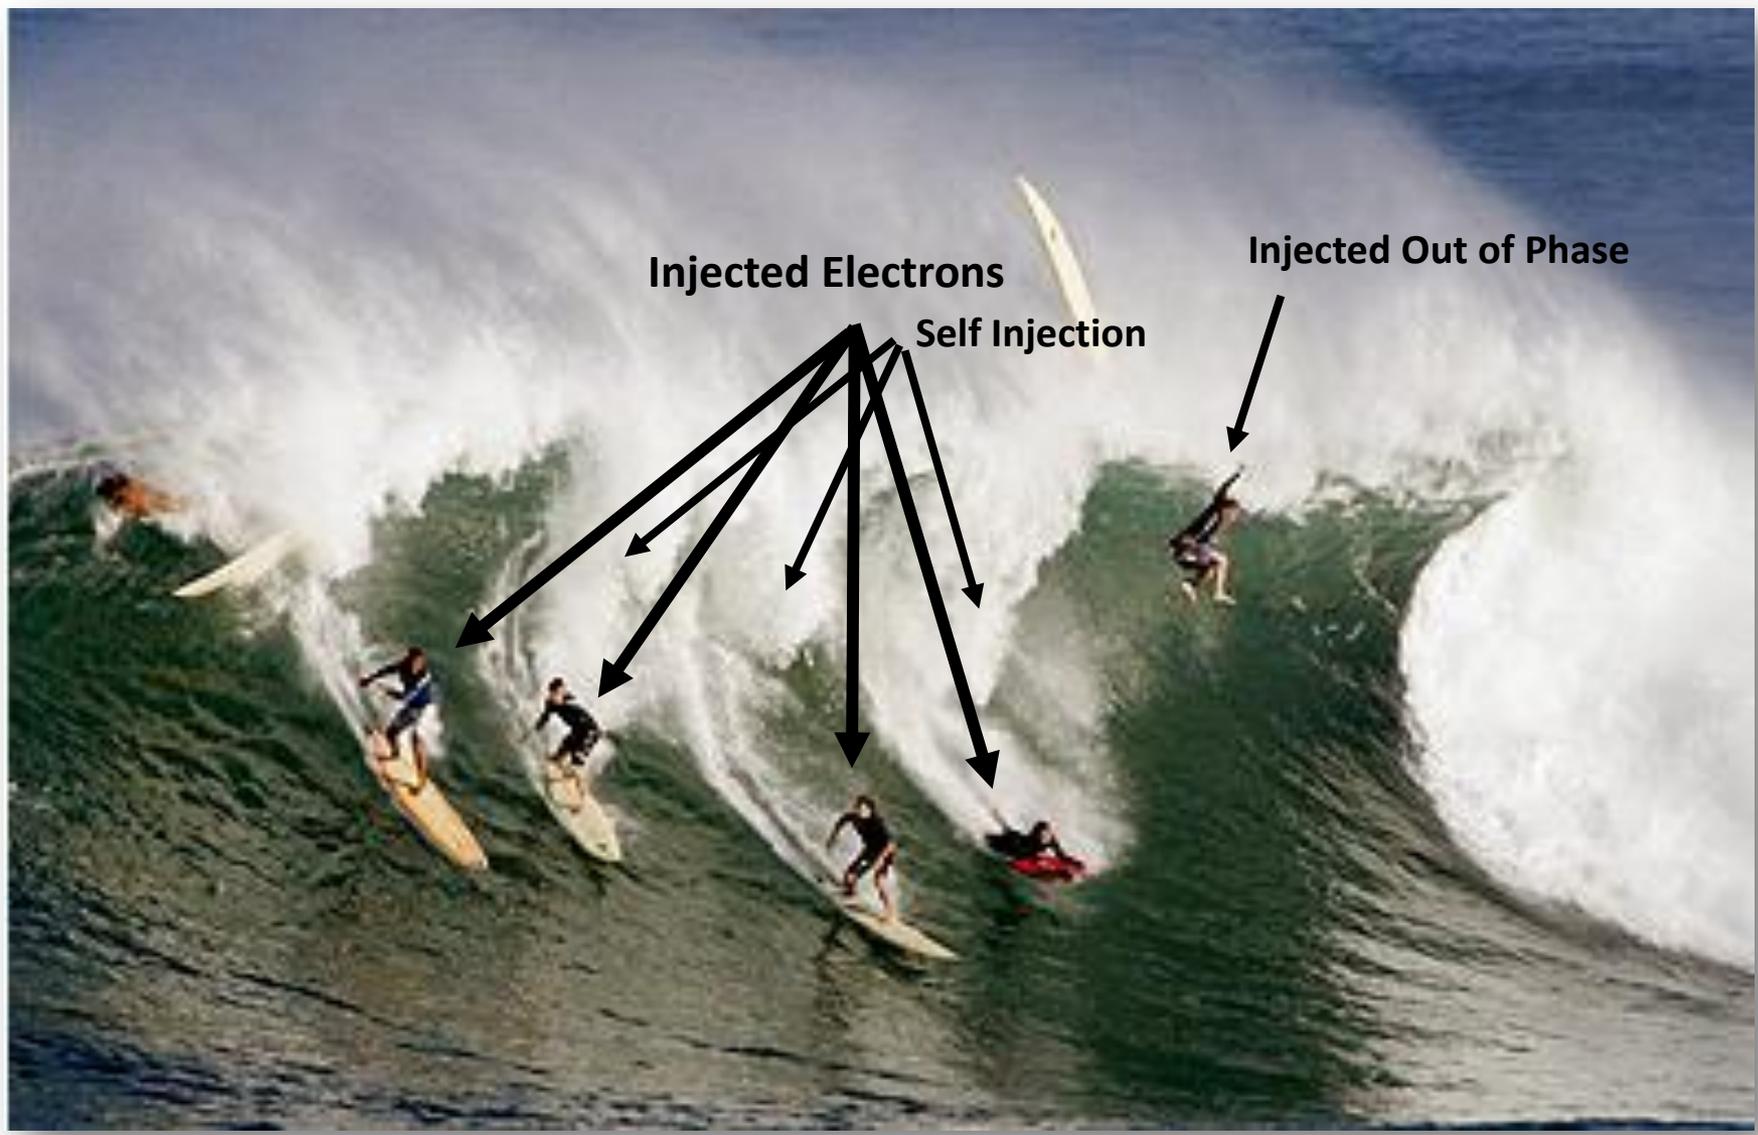

## Wake Generation

## Electron Acceleration

# Electrons surf on a plasma wave

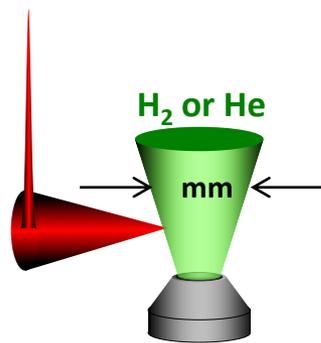

# Overview

- ❖ Introduction to laser plasma accelerators (LPAs)
- ❖ **Electrons from LPAs**
  - I. **Electron energies from MeV to GeV**
  - II. **Electron bunch temporal properties**
  - III. **Charge, divergence**
- ❖ X-rays from LPAs
  - I. Undulator radiation
  - II. Betatron radiation
  - III. Inverse Compton Scattering
- ❖ THz as Coherent Transition Radiation (Source & Diagnostic)
- ❖ Applications
  - I. Electron diffraction

	Electron Energy	Laser Peak Power	Target Type	Interaction Length	Name of system
1	1 MeV	10 TW	Gas Jet	< 0.6 mm	Godzilla
2	100 – 300 MeV	10 TW	Gas Jet	1 – 3 mm	Godzilla
3	0.3 – 1.1 GeV	50 TW	Capillary Discharge	3 cm	T-Rex
4	4+ GeV	1 PW	Capillary Discharge	9 cm	BELLA

## Laser – Plasma Accelerator Tuning Knobs

1. Laser Intensity/Energy
2. Interaction Length
  - Laser focal length
  - target density profile
3. Plasma Electron density
4. Injection method

**Gas Jet**

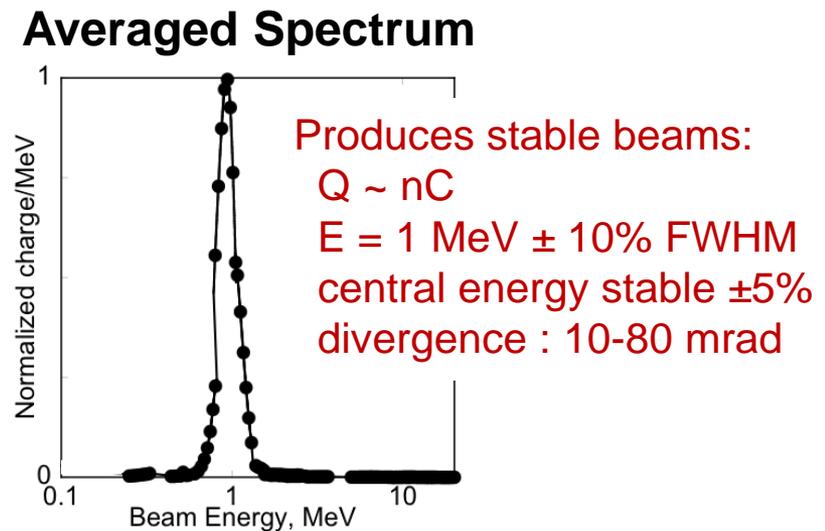

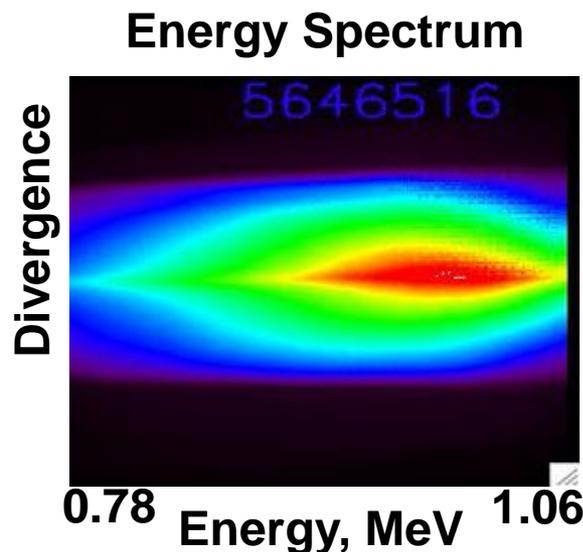

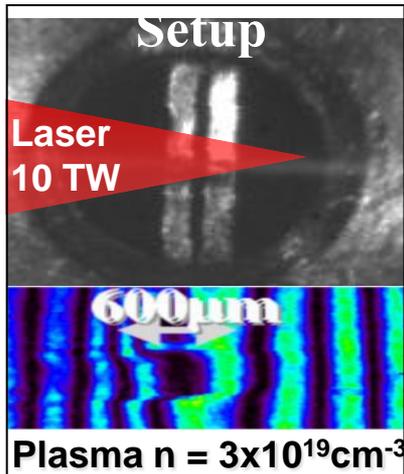

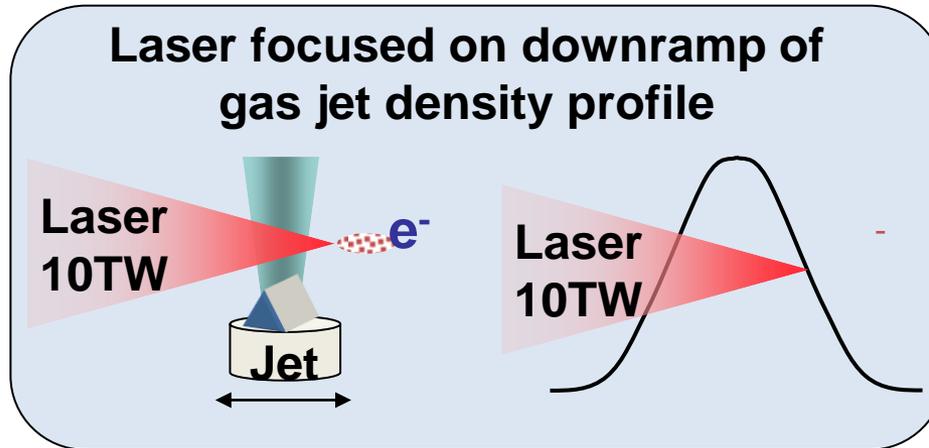

**Capillary Discharge (Guiding Structure)**

# Generation of 1 MeV electrons

*Geddes et al., PRL (2008)*

- Plasma down ramp decreases wake phase velocity (Bulanov, Suk):  
plasma wavelength increases as the laser propagates

# Downramp injector produces stable beams

Fig. 2 (Run A) Leemans et al., Compt Rendu Physique **10**,130 (2009)

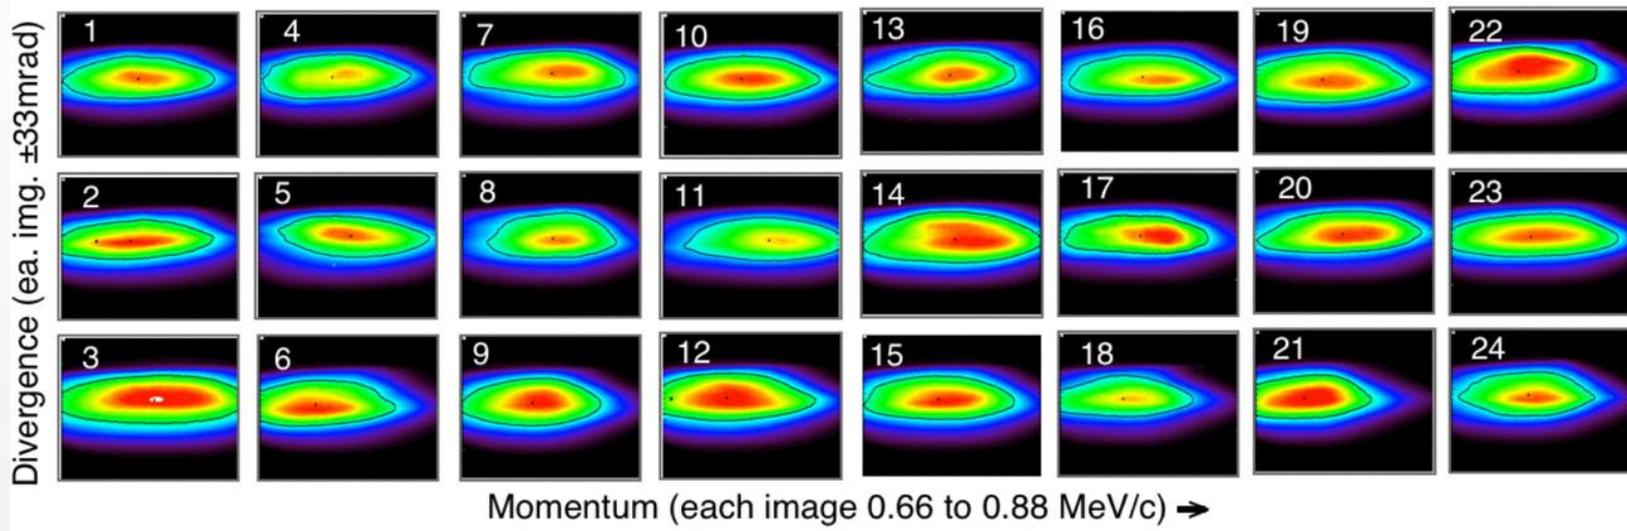

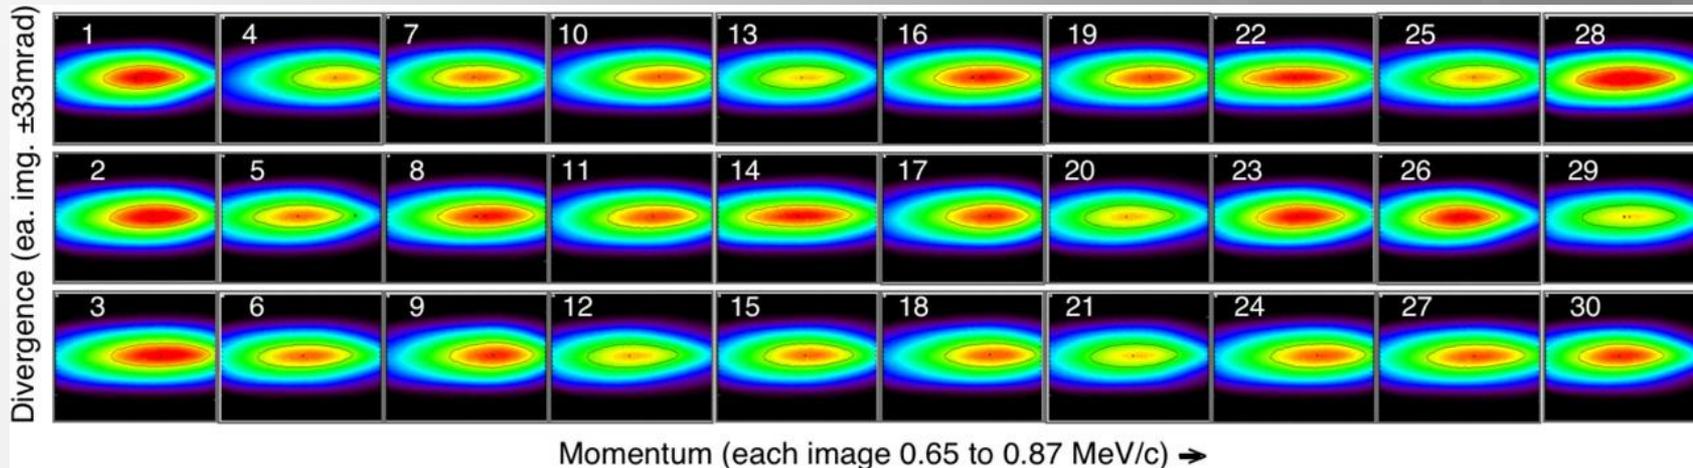

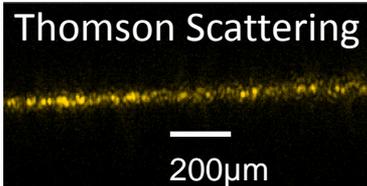

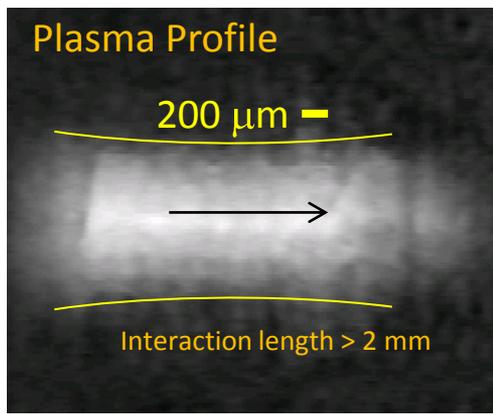

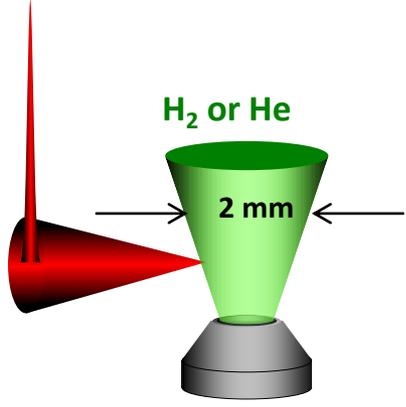

Fig. 4 (Run B, 123 hrs after Run A) Leemans et al., Compt Rendu Physique **10**,130 (2009)

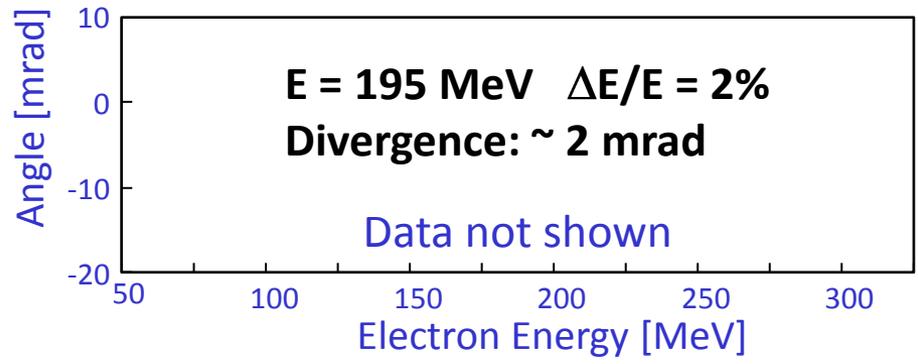

# Increasing interaction length to 2mm results in > 200 MeV electrons

Interaction Length > 2 mm

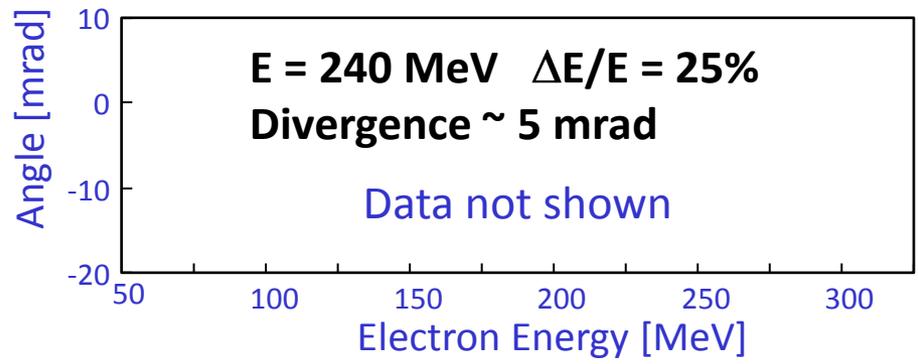

Regime I: High quality, but unstable

$$n_e = 1.0 \times 10^{19} \text{ cm}^{-3}$$

Regime II: High quality, but stable and large  $\Delta E$

$$n_e = 4.3 \times 10^{18} \text{ cm}^{-3}$$

4e18 cm<sup>-3</sup>

4.3e18 cm<sup>-3</sup>

4.7e18 cm<sup>-3</sup>

5.0e18 cm<sup>-3</sup>

Data not shown:

Multiple Beams

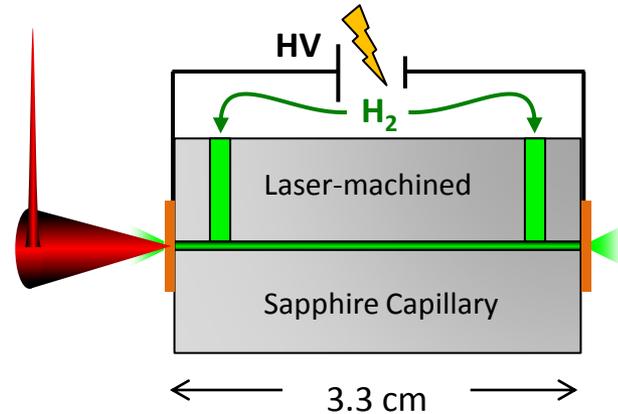

Energy 250 MeV

DE/E = 25%

Divergence: ~ 5 mrad

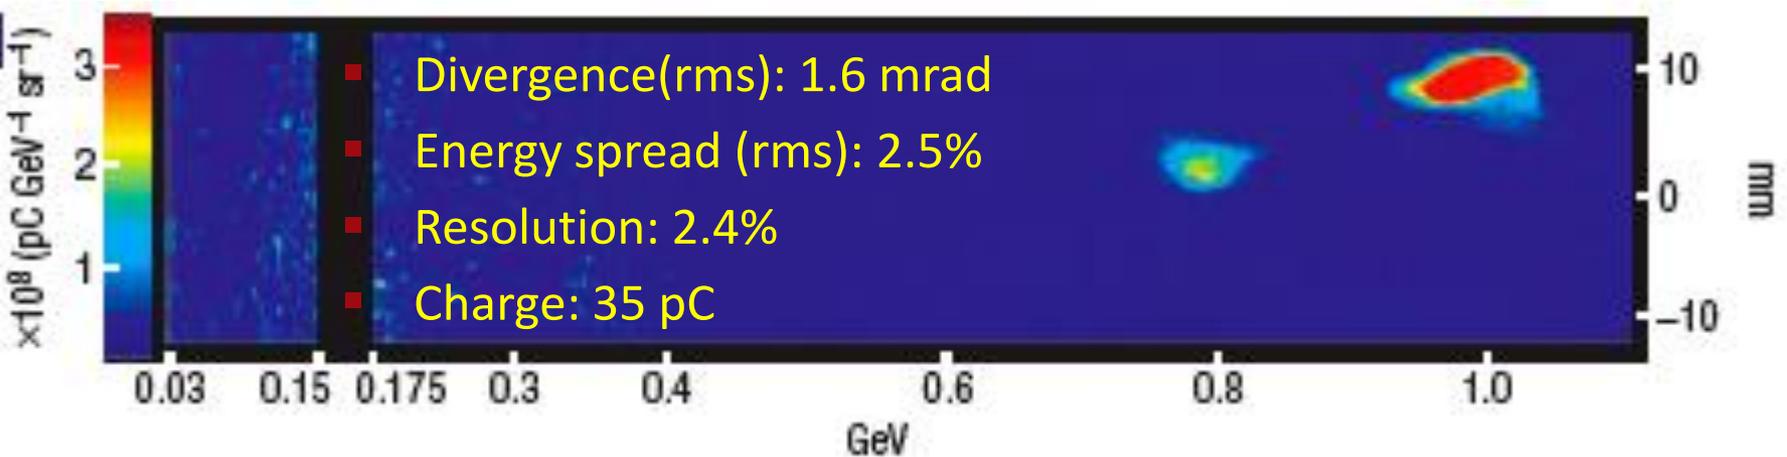

- Beam produced on nearly 100% of shots
- Energy spread is large
- Low energy component present
- Only one knob (pressure) & tuning range is small

# Increasing interaction length to 3cm results in > 1 GeV electrons

Capillary Discharge  
(Guiding Structure)

- $a_0 \sim 1.46$  (40 TW, 37 fs)
- $n_e \sim 10^{18} \text{cm}^{-3}$ ,  $P_{\text{crit}} \sim 7 \text{TW}$

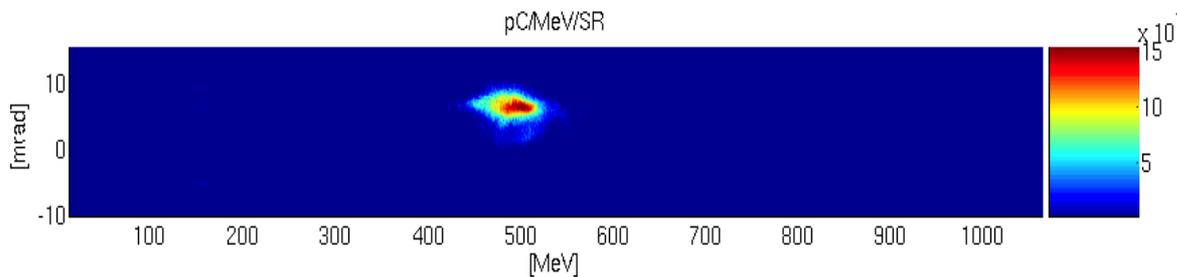

# Stable Regime Produces 500 MeV Beams

- Laser:  $a_0 > 0.77$  (12 TW, 80 fs)
- Capillary: 225  $\mu\text{m}$  diameter and 33 mm length
- $n_e \sim 3.5 \times 10^{18} \text{ cm}^{-3}$ ,  $P_{\text{crit}} \sim 9\text{TW}$

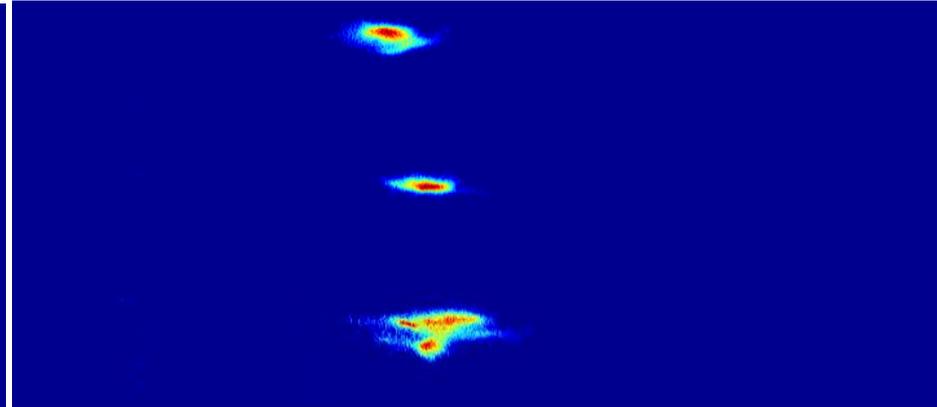

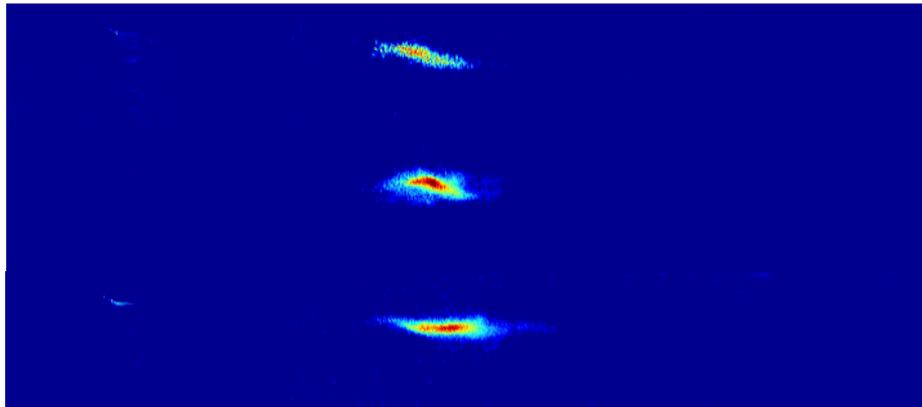

**500 MeV beam**

- Divergence(rms): 1.6 mrad
- Energy spread (rms): 5.6%
- Resolution: 1.1%
- Charge: 50pC

Charge= $32 \pm 14$ pC, Energy= $456 \pm 45$ MeV,  $dE/E = 6 \pm 3\%$

# Increasing Interaction length to 9 cm

...

BELLA (1Hz, 1 Petawatt) = 4+ GeV

More to come...

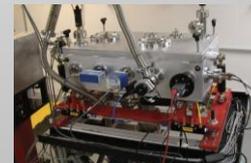

# Overview

- ❖ Introduction to laser plasma accelerators (LPAs)
- ❖ Electrons from LPAs

  - II. Electron bunch temporal properties
  - III. Charge, divergence
- ❖ X-rays from LPAs
  - I. Undulator radiation
  - II. Betatron radiation
  - III. Inverse Compton Scattering
- ❖ Transition radiation
  - I. THz as Coherent Transition Radiation (Source & Diagnostic)
- ❖ Applications
  - I. Electron diffraction

# Single-shot undulator spectra from broadband LPA e-beams observed!

## First demonstrations

- VISIBLE Light (Jena)  
Schlenvoigt et al, *Nature Phys* **4**, 130 (2008)
- VUV Radiation (MPQ)  
Fuchs et al, *Nature Phys* **5**, 826 (2009)

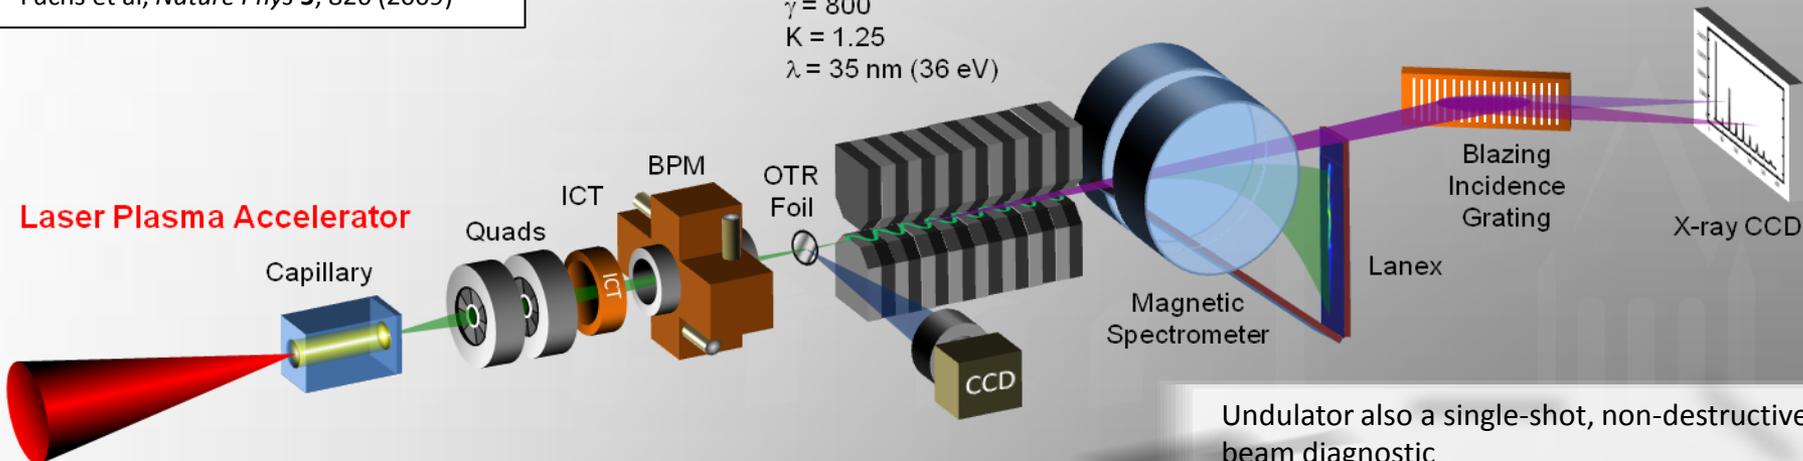

Also supported by:

Single-shot EUV Spectrometer

## Thunder Undulator

L = 1.5m (66 periods)  
 $\lambda_{und} = 2.2\text{cm}$   
 $\gamma = 800$   
 K = 1.25  
 $\lambda = 35\text{ nm}$  (36 eV)

Undulator also a single-shot, non-destructive e-beam diagnostic

Electron energy: 300 – 500 MeV

$$\lambda = \frac{\lambda_u}{2\gamma^2} \left( 1 + \frac{K^2}{2} \right)$$

Graph not shown: 30 nm spectrum

$10^4 - 10^5$  photons from  
 275 MeV Beam with  
 100% energy spread

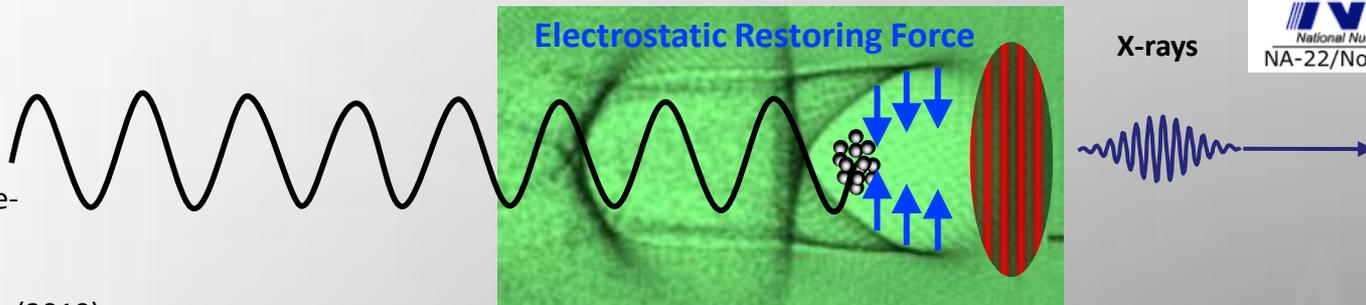

K. Robinson et al, *IEEE Quant Elect* (1987)

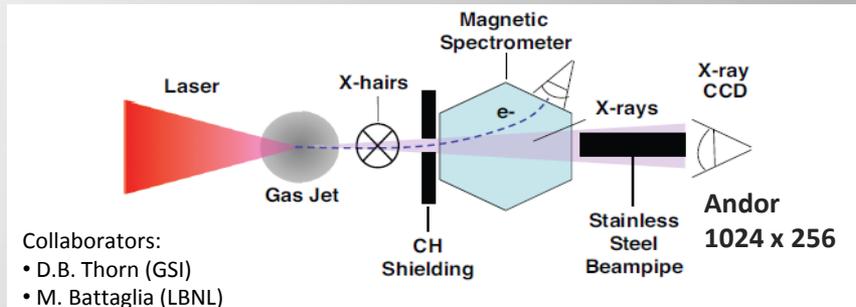

Dec 9, 2013

# keV X-rays produced in LPAs by Betatron oscillations

Esarey et al *Phys Rev E* **65**, 056505 (2002)

Kneip et al., Nature Physics (2010).

Collaborators:  
• D.B. Thorn (GSI)  
• M. Battaglia (LBNL)

Single shot image  $\sim 2e5$  photons on camera

## Gas Jet Experiment

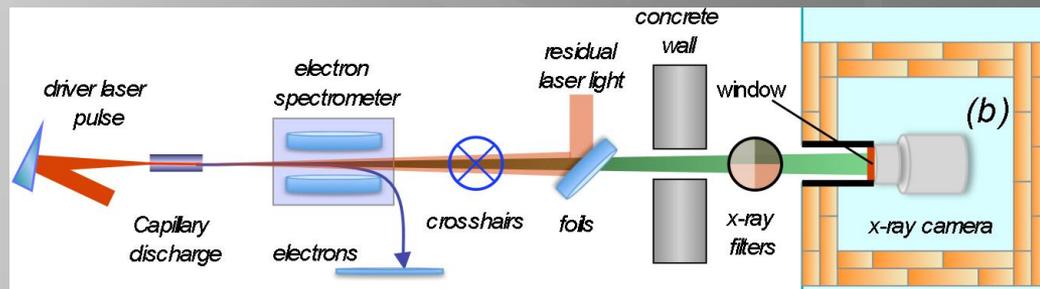

## Experiments on LOASIS capillary-based LPA<sup>1</sup>

Laser: 1.3J,  $\tau_p = 60$ fs,  $w_0 = 24\mu\text{m}$

Plasma:  $n_e = 5 \times 10^{18} \text{ cm}^{-3}$

e-beams  $\sim 0.5 \text{ GeV}$ , mrad divergence

<sup>1</sup> Leemans et al, Nature Physics 2006

# Single-shot Matching theory / data indicates beam size & emittance of 0.1 $\mu\text{m}$

▪  $n_e = 5 \times 10^{18} \text{ e}^-/\text{cm}^3$

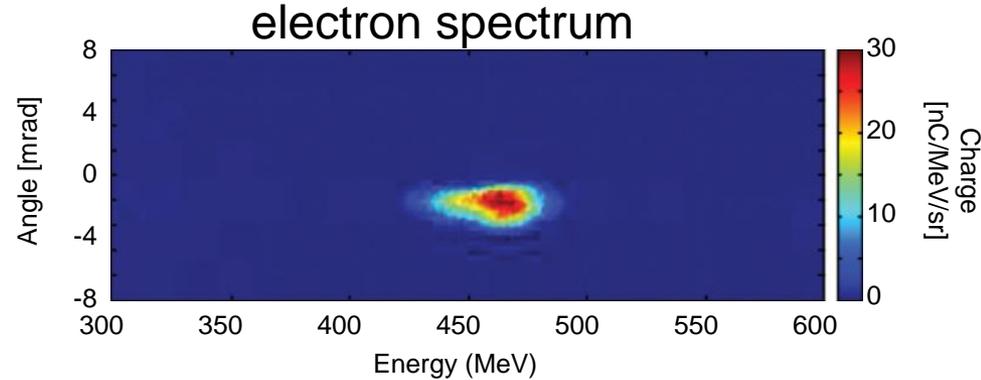

## Single-shot spectra

- $E_0 \sim 463 \text{ MeV}, \Delta E \sim 6.6\%$
- $Q \sim 0.4 \text{ pC}$ ,
- $\sigma_\theta \sim 1.2 \text{ mrad}$

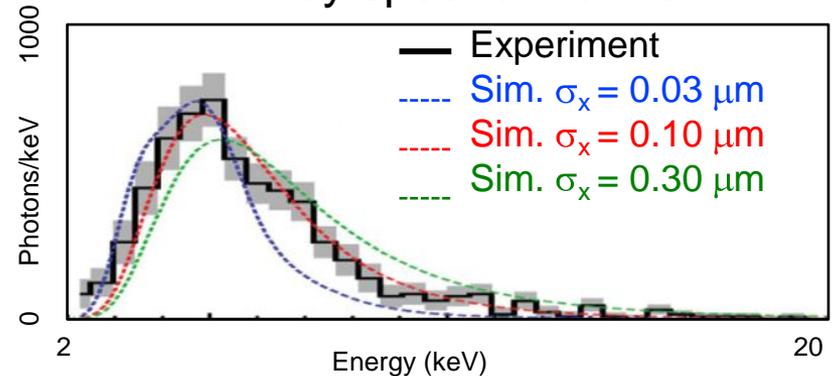

$$a_\beta \propto r_\beta (\gamma n_e)^{1/2}$$

## X-ray spectrum constrains emittance:

- $\sigma_x \sim 0.1 \mu\text{m}$
- $\epsilon_x \approx \gamma \sigma_x \sigma_\theta \approx 0.1 \text{ mm-mrad}$

## X-ray spectrum & fits

Simulations: Virtual Detector of Synchrotron Radiation (VDSR)  
M. Chen et al., PRSTAB **16**, 030701 (2013)

# LPA beams can be used to produce gamma sources

## $\gamma$ -rays suitable for Special Nuclear Material (SNM) detection

- 1-20 MeV  $\gamma$ 's from 0.3-1 GeV  $e^-$
- 1% level gamma  $\Delta E$  achievable
- Low divergence: standoff possible

# Evidence for Coherent OTR at 3m

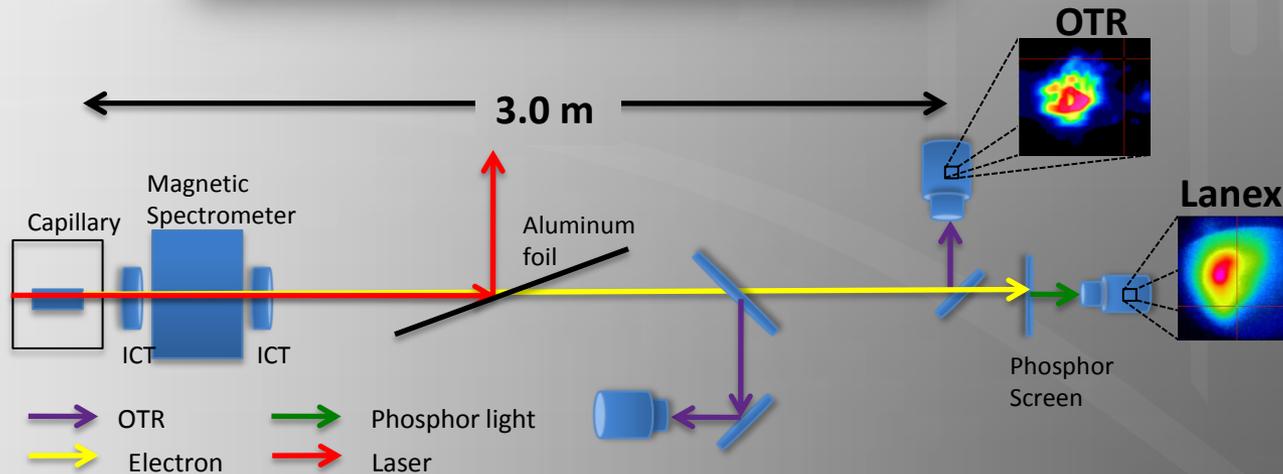

Glinec et al, PRL **98**, 194801 (2007)

Coherent OTR at 1.5 - 140 mm

- First observation of Coherent OTR at meter distances
- Laser completely blocked
- Indicates presence of micro-bunching (fs level)

## LOASIS Experiment

❖ LPAs generate electron beams with energies from MeV to GeV

	Electron Energy	Laser Peak Power	Target Type	Interaction Length	Name of system
1	1 MeV	10 TW	Gas Jet	< 0.6 mm	Godzilla
2	100 – 300 MeV	10 TW	Gas Jet	1 – 3 mm	Godzilla
3	0.3 – 1.1 GeV	50 TW	Capillary Discharge	3 cm	T-Rex
4	4+ GeV	1 PW	Capillary Discharge	9 cm	BELLA

❖ Charge ~ pC – nC, bunch duration: few fs

❖ LPAs also generate other forms of radiation

- I. Electrons (1 MeV to 4 GeV @ LOASIS)
- II. THz (1 – 10 THz)
- III. VUV (30nm)
- IV. X-Ray (1 – 20 keV)
- V. Gamma-Ray (MeV – GeV, simulated)

❖ Outputs are intrinsically synchronized
