A TAYLOR & FRANCIS BOOK

An Introduction to Beam Physics

Series in High Energy Physics, Cosmology, and Gravitation

Series Editors: **Brian Foster**, *Oxford University, UK*

Edward W Kolb, *Fermi National Accelerator Laboratory, USA*

This series of books covers all aspects of theoretical and experimental high energy physics, cosmology and gravitation and the interface between them. In recent years the fields of particle physics and astrophysics have become increasingly interdependent and the aim of this series is to provide a library of books to meet the needs of students and researchers in these fields.

Other recent books in the series:

The Standard Model and Beyond

P. Langacker

Particle and Astroparticle Physics

U. Sakar

Joint Evolution of Black Holes and Galaxies

M. Colpi, V. Gorini, F. Haardt, and U. Moschella (*Eds*)

Gravitation: From the Hubble Length to the Planck Length

I. Ciufolini, E. Coccia, V. Gorini, R. Peron, and N. Vittorio (*Eds*)

Neutrino Physics

K. Zuber

The Galactic Black Hole: Lectures on General Relativity and Astrophysics

H. Falcke and F. Hehl (*Eds*)

The Mathematical Theory of Cosmic Strings: Cosmic Strings in the Wire Approximation

M. R. Anderson

Geometry and Physics of Branes

U. Bruzzo, V. Gorini, and U. Moschella (*Eds*)

Modern Cosmology

S. Bonometto, V. Gorini, and U. Moschella (*Eds*)

Gravitation and Gauge Symmetries

M. Blagojevic

Gravitational Waves

I. Ciufolini, V. Gorini, U. Moschella, and P. Fré (*Eds*)

Neutrino Physics, Second Edition

K. Zuber

A TAYLOR & FRANCIS BOOK

Contents

1 Beams and Beam Physics	1
1.1 What Is Beam Physics?	1
1.2 Production of Beams	4
1.2.1 Electron Sources	4
1.2.2 Proton Sources	8
1.2.3 Ion Sources	9
1.3 Acceleration of Beams	10
1.3.1 Electrostatic Accelerators	12
1.3.2 Linear Accelerators	15
1.3.3 Circular Accelerators	19
2 Linear Beam Optics	31
2.1 Coordinates and Maps	32
2.2 Glass Optics	36
2.2.1 The Drift	37
2.2.2 The Thin Lens	37
2.2.3 The Thin Mirror	40
2.2.4 Liouville's Theorem for Glass Optics	41
2.3 Special Optical Systems	43
2.3.1 Imaging (Point-to-Point, $\bullet \bullet$) Systems	44
2.3.2 Parallel-to-Point ($\parallel \bullet$) Systems	45
2.3.3 Point-to-Parallel ($\bullet \parallel$) Systems	46
2.3.4 Parallel-to-Parallel ($\parallel \parallel$) Systems	47
2.3.5 Combination Systems	48
3 Fields, Potentials and Equations of Motion	49
3.1 Fields with Straight Reference Orbit	50
3.1.1 Expansion in Cylindrical Coordinates	50
3.1.2 Quadrupole Fields	53
3.1.3 Sextupole and Higher Multipole Fields	54
3.1.4 s -Dependent Fields	55
3.2 Fields with Planar Reference Orbit	57
3.2.1 The Laplacian in Curvilinear Coordinates	57
3.2.2 The Potential in Curvilinear Coordinates	58
3.3 The Equations of Motion in Curvilinear Coordinates	60
3.3.1 The Coordinate System and the Independent Variable	60
3.3.2 The Equations of Motion	65

4 The Linearization of the Equations of Motion	67
4.1 The Drift	69
4.2 The Quadrupole without Fringe Fields	70
4.2.1 The Electric Quadrupole	70
4.2.2 The Magnetic Quadrupole	72
4.3 Deflectors	73
4.3.1 The Homogeneous Magnetic Dipole	73
4.3.2 Edge Focusing	76
4.3.3 The Inhomogeneous Sector Magnet	82
4.3.4 The Inhomogeneous Electric Deflector	83
4.4 Round Lenses	87
4.4.1 The Electrostatic Round Lens	89
4.4.2 The Magnetic Round Lens	97
4.5 *Aberration Formulas	107
5 Computation and Properties of Maps	115
5.1 Aberrations and Symmetries	115
5.1.1 Horizontal Midplane Symmetry	116
5.1.2 Double Midplane Symmetry	118
5.1.3 Rotational Symmetry	119
5.1.4 Symplectic Symmetry	123
5.2 Differential Algebras	128
5.2.1 The Structure ${}_1D_1$	129
5.2.2 The Structure ${}_nD_v$	131
5.2.3 Functions on Differential Algebras	133
5.3 The Computation of Transfer Maps	134
5.3.1 An Illustrative Example	134
5.3.2 Generation of Maps Using Numerical Integration	136
5.4 Manipulation of Maps	137
5.4.1 Composition of Maps	137
5.4.2 Inversion of Maps	138
5.4.3 Reversion of Maps	139
6 Linear Phase Space Motion	141
6.1 Phase Space Action	142
6.1.1 Drifts and Lenses	142
6.1.2 Quadrupoles and Dipoles	143
6.2 Polygon-like Phase Space	144
6.3 Elliptic Phase Space	145
6.3.1 The Practical Meaning of α , β and γ	147
6.3.2 The Algebraic Relations among the Twiss Parameters	149
6.3.3 The Differential Relations among the Twiss Parameters	154
6.4 *Edwards-Teng Parametrization	155
6.4.1 The Algebraic Relations with Coupling	157

7 Imaging Devices	161
7.1 The Cathode Ray Tube (CRT)	161
7.2 The Camera and the Microscope	162
7.3 Spectrometers and Spectrographs	164
7.3.1 Aberrations and Correction	170
7.3.2 Energy Loss On-Line Isotope Separators	174
7.4 *Electron Microscopes and Their Correction	176
7.4.1 Aberration Correction in SEM, STEM and TEM	178
7.4.2 Aberration Correction in PEEM and LEEM	183
8 The Periodic Transport	189
8.1 The Transversal Motion	189
8.1.1 The Eigenvalues	189
8.1.2 The Invariant Ellipse	194
8.2 Dispersive Effects	198
8.2.1 The Periodic Solution	198
8.2.2 Chromaticity	200
8.3 A Glimpse at Nonlinear Effects	205
9 Lattice Modules	207
9.1 The FODO Cell	208
9.1.1 The FODO Cell Based Achromat	214
9.1.2 The Dispersion Suppressor	224
9.2 Symmetric Achromats	226
9.2.1 The Double-Bend Achromat	229
9.2.2 The Triple-Bend Achromat	230
9.2.3 The Multiple-Bend Achromat	230
9.2.4 The \mathcal{H} Function	231
9.3 Special Purpose Modules	235
9.3.1 The Low Beta Insertion	235
9.3.2 The Chicane Bunch Compressor	236
9.3.3 Other Bunch Compressors	240
10 Synchrotron Motion	241
10.1 RF Fundamentals	241
10.2 The Phase Slip Factor	245
10.3 Longitudinal Dynamics	252
10.4 Transverse Dynamics of RF Cavities	257

List of Figures

1.1	A beam — an ensemble of particles in the vicinity of a reference particle with phase space coordinate \vec{Z}_0	2
1.2	Sketch of an early thermionic emission electron source.	5
1.3	Sketch of one of the earliest electron sources using point cathodes.	6
1.4	Layout and field distribution of the RF gun at the Linac Coherent Light Source (LCLS).	8
1.5	Drawing of a surface plasma source of the magnetron geometry.	9
1.6	Layout of the first electron cyclotron resonance (ECR) ion source that produced multiple charged ions.	11
1.7	The general principle of the Cockcroft-Walton generator.	12
1.8	Design sketch of the Van de Graaff high voltage generator.	13
1.9	Design sketch of the use of the Van de Graaff generator as a particle accelerator.	14
1.10	The principle of the tandem Van de Graaff accelerator.	15
1.11	Sketch of the principle of the linear accelerator of the Wideröe type.	16
1.12	Illustration of a linear accelerator, designed by E. O. Lawrence and H. D. Sloan.	17
1.13	Sketches illustrating the basic principles of the linear accelerator of the Alvarez type.	18
1.14	The structure of the RFQ, the radio-frequency quadrupole linear accelerator.	18
1.15	Sketch of the first Free Electron Laser (FEL).	20
1.16	Illustration of the magnet of a betatron.	21
1.17	Illustration of the first microtron.	23
1.18	The principle of the cyclotron.	24
1.19	The first model of an FFAG, the Fixed-Field Alternating Gradient accelerator.	25
1.20	Sketch of the Bevatron, designed to achieve “Billions of eV Synchrotron,” at Lawrence Berkeley National Laboratory, California, USA.	26
1.21	Layout of the Cooler Synchrotron (COSY) ring at the Institute of Nuclear Physics (IKP) at Forschungszentrum Jülich, Germany.	27

1.22 Layout of the Super-ACO light source storage ring at Laboratoire pour l'Utilisation du Rayonnement Electromagnétique, Orsay, France.	28
1.23 Layout of the Advanced Light Source (ALS) at Lawrence Berkeley National Laboratory, California, USA.	29
2.1 Reference orbit, arc length s along it and local coordinates.	32
2.2 Motion of particles inside the tube with radius r_{tube} around the reference orbit.	33
2.3 A ray passing through a drift.	37
2.4 A bundle of parallel rays passing through a focusing lens.	38
2.5 A bundle of parallel rays passing through a defocusing lens.	39
2.6 A bundle of parallel rays is reflected by the focusing mirror.	41
2.7 Liouville's theorem.	42
2.8 Poincaré's recurrence theorem.	43
2.9 Sketch of an imaging system.	44
2.10 Sketch of a parallel-to-point system.	46
2.11 Sketch of a point-to-parallel system.	46
2.12 Sketch of a parallel-to-parallel system.	47
3.1 Ideal electrodes of an electrostatic quadrupole.	54
3.2 The s -dependence of the multipole strength.	55
3.3 Scalar potential, longitudinal and radial field distribution of a rotationally symmetric lens.	56
3.4 Reference orbit of a bending magnet.	57
3.5 The curvilinear coordinates in the plane of the reference orbit.	62
4.1 A homogeneous magnetic dipole.	73
4.2 Entrance and exit edge lines of a dipole magnet.	77
4.3 Mechanism of edge focusing for the horizontal plane and the vertical plane.	78
4.4 An inhomogeneous sector magnet.	82
4.5 An electric capacitor consisting of two parallel plates. The orbit of a particle is parabolic.	84
4.6 A concentric electric deflector.	84
4.7 An electric deflector with cylindrical plates.	86
4.8 An electric deflector with spherical plates.	86
4.9 Layout and potential profile of the electrostatic three-plate round lens.	96
4.10 Transversal motion of particles entering initially parallel to the reference axis in the magnetic solenoid.	100
5.1 Trajectories of particles in a system with horizontal midplane symmetry.	117
5.2 Motion in a 90° homogeneous dipole magnet.	135
6.1 Mapping of individual points in phase space.	141
6.2 Mapping of a closed curve in phase space.	142
6.3 Action of a drift in phase space.	143
6.4 Action of a thin lens in phase space.	144

6.5	Action of a quadrupole or dipole in phase space.	144
6.6	Mapping of a polygon in phase space.	145
6.7	An ellipse in phase space.	146
6.8	Characteristic points of an ellipse in phase space.	147
6.9	Sketch of horizontal and vertical β functions of a beamline. .	148
6.10	Transformation of an ellipse under a drift.	152
6.11	Plot of the β function in a drift.	153
7.1	Sketch of an imaging system.	161
7.2	Curvature of the image.	163
7.3	The Browne-Buechner spectrograph.	165
7.4	Illustration of the imaging condition arising from Barber's rule.	166
7.5	Sketch of a generic spectrograph consisting of a single dipole. .	168
7.6	Sketch of a generic spectrograph now subject to aberrations up to order seven.	169
7.7	The effect of the aberration ($x a\delta$).	170
7.8	A magnified drawing of the effect of the aberration ($x a\delta$). . .	171
7.9	Layout of an example of a fragment separator.	175
7.10	Spherical and chromatic aberrations.	177
7.11	Cosine-like rays and sine-like rays of the quadruplet corrector. .	179
7.12	A quadrupole-octupole C_S corrector.	179
7.13	A sextupole C_S corrector.	181
7.14	Sine-like and cosine-like rays of a C_S corrected TEM from objective lens to the end of the corrector section.	181
7.15	Sine-like and cosine-like rays of the TEAM corrector.	182
7.16	Sine-like and cosine-like rays of the TEAM microscope from objective lens to end of the corrector section.	182
7.17	Spherical and chromatic aberrations of an electron mirror. . .	183
7.18	Geometry of the tetrode mirror in PEEM3.	184
7.19	Layout of PEEM3.	184
7.20	The beam separator of the first aberration-corrected PEEM. .	185
7.21	The PEEM3 beam separator.	186
7.22	Sine-like, cosine-like and dispersive rays of the PEEM3 beam separator.	186

9.2 The “necktie” diagram showing the stability region of a FODO cell.	209
9.3 Sketch of a FODO cell with bending magnets.	209
9.4 Lattice functions of a FODO cell at the Fermilab Main Injector. .	212
9.5 The simplest double-bend achromat.	230
9.6 The double-bend achromat.	230
9.7 Lattice functions of a double-bend achromat.	231
9.8 The triple-bend achromat.	231
9.9 Lattice functions of a triple-bend achromat of the Advanced Light Source.	232
9.10 Lattice functions of the MAX IV multiple-bend achromat lattice.	233
9.11 Lattice functions of a typical low beta insertion with symmetric quadrupole triplets.	236
9.12 Layout of the chicane bunch compressor.	237
9.13 Mechanism of an RF buncher cavity.	240
10.1 Typical RF cavity field with fundamental mode TM_{010}	242
10.2 Dependence of transit time factor on length of the cavity.	246
10.3 Sketch of phase stability for energy below transition.	249
10.4 Sketch of phase stability for energy above transition.	250
10.5 Phase space plots of longitudinal motion with $\phi_s = \pi/2$ and $\phi_s = \pi/3$	257
10.6 Longitudinal and transverse field distribution along the longitudinal axis.	258
11.1 Distinct eigenvalues around the unit circle.	277
11.2 Crossing the difference resonance.	279
11.3 Invariant obtained through first order perturbation theory and tracking.	287
11.4 Invariant obtained through first order perturbation theory and tracking.	287

Preface

This volume provides an introduction to the physics of beams. This field touches many other areas of physics, engineering and the sciences, and in turn benefits from numerous techniques also used in other disciplines. In general terms, beams describe ensembles of particles with initial conditions similar enough to be treated together as a group, so that the motion is a weakly nonlinear perturbation of that of a chosen reference particle.

Applications of particle beams are very wide, including electron microscopes, particle spectrometers, medical irradiation facilities, powerful light sources, astrophysics – to name a few – and reach all the way to the largest scientific instruments built by man, namely, large colliders like LHC at CERN.

The text is based on lectures given at Michigan State University's Department of Physics and Astronomy, the online VUBeam program, the US Particle Accelerator School, the CERN Academic Training Programme, and various other venues. Selected additional material is included to round out the presentation and cover other significant topics.

The material is at a level to be accessible to students of physics, mathematics and engineering at the beginning graduate or upper division undergraduate level and can be viewed as an introductory companion to the more advanced *Modern Map Methods in Particle Beam Physics* by M. B., published by Academic Press. Emphasis has been placed on showing major concepts in their original incarnations and through historic figures. Finally, some of the sections and chapters that contain more advanced material are marked by a * symbol and can be omitted in a first reading.

Many organizations and individuals have helped directly and indirectly at various stages in the development of this book. MSU's Physics and Astronomy Department provided an environment of support for this and other books, the VUBeam program, as well as many of our other activities.

For two decades of continuous financial support that were instrumental to the success of the book, the VUBeam program, and indeed much of our research, we are grateful to the US Department of Energy, and in particular to Dr. Dave Sutter, the long-term coordinator of their beam physics activities.

K. M. would like to thank her daughter Kazuko for her own great interest in physics and science and much encouragement during the finalization of this text.

W. W. would like to thank Dr. D. Robin for his encouragement, Dr. E. Forest for stimulating discussions on various aspects of beam dynamics such as normal form theory, and his wife Juxiang Teng for her unwavering support

throughout this project.

All of us want to thank Béla Erdélyi, Gabi Weizman, Pavel Snopok and He Zhang for thoughtful comments about the material. We also are thankful to many authors, national laboratories and publishers allowing us to reproduce published figures. The details are described in the corresponding figure captions.

Last but not least, we are very grateful to the entire staff of Taylor & Francis for their continuous support, in particular to Francesca McGowan for her great interest and productive comments.

An Introduction to Beam Physics

Martin Berz, Kyoko Makino and Weishi Wan

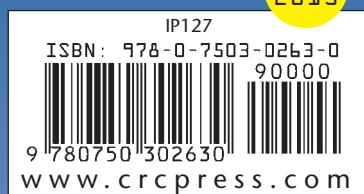

The field of beam physics touches many areas of physics, engineering and the sciences. In general terms, beams describe ensembles of particles with initial conditions similar enough to be treated together as a group so that the motion is a weakly nonlinear perturbation of a chosen reference particle. Particle beams are used in a variety of areas, ranging from electron microscopes, particle spectrometers, medical radiation facilities, powerful light sources and astrophysics to large synchrotrons and storage rings such as the LHC at CERN.

An Introduction to Beam Physics is based on lectures given at Michigan State University's Department of Physics and Astronomy, the online VUBeam program, the U.S. Particle Accelerator School, the CERN Academic Training Programme and various other venues. It is accessible to beginning graduate and upper-division undergraduate students in physics, mathematics and engineering. The book begins with a historical overview of methods for generating and accelerating beams, highlighting important advances through the eyes of their developers using their original drawings. The book then presents concepts of linear beam optics, transfer matrices, the general equations of motion and the main techniques used for single- and multi-pass systems. Some advanced nonlinear topics, including the computation of aberrations and a study of resonances, round out the presentation.

Features

- Provides an introduction to the physics of beams from a historical perspective
- Describes the production, acceleration and optics of beams
- Discusses transfer matrices and maps for particle accelerators and other weakly nonlinear dynamical systems
- Covers various important devices used for imaging and repetitive systems, including electron microscopes, spectrometers and storage rings
- Incorporates some advanced material such as aberration integrals and the treatment of resonances
